

This trading bot is designed to automate cryptocurrency trading on Binance. It integrates a **Python backend** with a **Tkinter-based UI**, providing real-time order placement, error handling, and order history tracking. The bot emphasizes modularity, validation, and user-friendly design.

- **Backend (Python + Binance API):**
 - Uses python-binance for API communication.
 - Implements functions for market, limit, and stop-limit orders.
 - Includes error handling and logging for compliance and debugging.
- **Frontend (Tkinter UI):**
 - Provides input fields for symbol, side, type, quantity, and price.
 - Anchored, scrollable order history for real-time updates.
 - Dynamic frames adapt to trade type selection.

Entry types :

- **Market order**
 - Market order is immediately matched to the best available market price.
 - For buy orders, the average filled price might be a bit higher than the current price. And for sell orders, the average filled price might be a bit lower than the current price.
- **Stop-limit order**
 - A stop-limit order is a order that has both a stop price and a limit price. when the stop price is reached, it triggers the limit order.
 - Limit order is invalid before the stop-price is triggered, including when the limit price is reached ahead of the stop price.
- **Limit order**
 - A limit order is to buy or sell at a specific price or better. Limit order are not guaranteed to execute.
